REQUEST TO CORRECT A CERTIFICATE OF CORRECTION

Mail Stop: Corrections
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

In reviewing the Certificate of Correction issued on August 1, 2006 for the above-identified patent, Applicant noticed that the following corrections were not included on said Certificate of Correction:

- 1) The errors cited on Column 1, Lines 36 and 62 and Column 3, Line 67 through Column 4, Line 1. As shown on the Request for a Certificate of Correction filed on April 16, 2006. Exhibit A.

- 2) Allowed claim number 27 on the Amendment filed with the Request for Continued Examination (RCE) filed on February 20, 2004. See Exhibit B.
- 3) A copy of the Certificate of Correction issued on August 1, 2006. See Exhibit C.

It is respectfully requested that a **corrected Certificate of Correction** be issued, accepted and placed in the file of the above-noted patent.

The Director is hereby authorized to charge any deficiency in the payment of the required fee(s) or credit any overpayment to the Deposit Account No. 20-1495.

Should there be any questions regarding this Communication, please contact one of the undersigned attorneys at (312) 704-1890.

Respectfully submitted,

Date:

AMENDMENT

Commissioner for Patents
P.O. Box 1450
Arlington, VA 22313-1450

Sir:

Responsive to the Notice of Allowance dated November 20, 2003 and in accordance with the Request for Continued Examination submitted concurrently herewith, kindly amend the above-identified patent application as follows:

IN THE CLAIMS:

1. (Currently Amended) A laundry machine drum having a sheet material skin including an arrangement of a plurality of perforations therethrough, each of one or more of said perforations including:

a shear cut in said sheet material, the sheet being deformed in the region of said shear cut such that the edge of the sheet material of one side of said shear cut is offset from the edge of the sheet material of the other side of said shear cut over at least some of the length of said shear cut such that an opening is formed between said offset edges and the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation;

wherein said drum skin includes a plurality of dish like depressions on its inner surface, with at least one said drum perforation located within each said dish.

2. (Original) A laundry machine drum as claimed in claim 1 wherein said deformed sheet material the material of one said side of said shear cut is displaced outward from the material of the other side of said shear cut relative to the intended spin axis of said drum, but the planar orientation of said regions immediately adjacent the edges of said regions at said shear cut are parallel to one another.

3. (Original) A laundry machine drum as claimed in claim 2 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

4. (Original) A laundry machine drum as claimed in claim 1 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

5. (Cancelled)

6. (Original) A laundry machine drum as claimed in claim 4 wherein said group of drum perforations is located within a dish in the drum skin extending outwardly relative to the drum spin axis.

7. (Original) A laundry machine drum as claimed in claim 6 wherein said dish includes two said perforations opposingly oriented to one another such that the shear cuts thereof are parallel and a bridge of material is defined by said parallel cuts.

8. (Original) A laundry machine drum as claimed in claim 7 wherein said bridge of material is spaced outwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

9. (Original) A laundry machine drum as claimed in claim 7 wherein said bridge of material is spaced inwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

Claims 10-16 (Cancelled)

17. (Currently Amended) ~~A laundry machine drum having~~ In a laundry machine having a drum with a sheet material skin including an arrangement of a plurality of openings therethrough, which drum is spun at high speed in a dehydration operation to extract wash liquids by centrifugal forces, the improvement comprising: at least one of said openings opening having a form such that the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation opening than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation opening, such that fabric spans said openings but does not extrude through said openings during said centrifugal dehydration.

18. (New) The improvement as claimed in claim 17 wherein said form of said openings is such that material surrounding said opening does not project into said drum beyond said general plane of said drum skin.

19. (New) The improvement as claimed in claim 18 wherein said apparent area of said opening when viewed from substantially perpendicular to the general plane of said drum skin in said regions of said opening is substantially zero.

20. (New) A laundry machine having a drum as claimed in claim 17 wherein said apparent area of said opening when viewed from substantially perpendicular to the general plane of said drum skin in said regions of said opening is substantially zero.

21. (New) In a laundry machine having a drum for holding a laundry load, which drum is spun at high speed in a dehydration operation to extract wash liquids by centrifugal forces, the drum having a sheet material skin including an arrangement of a plurality of perforations therethrough, the improvement comprising each of one or more of said perforations including:

a shear cut in said sheet material, the sheet being deformed in the region of said shear cut such that the edge of the sheet material of one side of said shear cut is offset from the edge of the sheet material of the other side of said shear cut over at least some of the length of said shear cut such that an opening is formed between said offset edges and the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation.

22. (New) The improvement as claimed in claim 21 wherein said drum perforation is such that during said centrifugal dehydration said fabric spans said perforation but does not extrude through said perforation.

23. (New) The improvement as claimed in claim 21 wherein said perforation does not project into said drum beyond said general plane of said drum skin.

24. (New) The improvement as claimed in claim 23 wherein said deformed sheet material the material of one said side of said shear cut is displaced outward from the material of the other side of said shear cut relative to the intended spin axis of said drum, but the planar orientation of said regions immediately adjacent the edges of said regions at said shear cut are parallel to one another.

25. (New) The improvement as claimed in claim 24 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

26. (New) The improvement as claimed in claim 21 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

27. (New) The improvement as claimed in claim 21 wherein said drum skin includes a plurality of dish-like depressions on its inner surface, with at least one said drum perforation located within each said dish.

28. (New) The improvement as claimed in claim 26 wherein said group of drum perforations is located within a dish in the drum skin extending outwardly relative to the drum spin axis.

29. (New) The improvement as claimed in claim 28 wherein said dish includes two said perforations opposingly oriented to one another such that the shear cuts thereof are parallel and a bridge of material is defined by said parallel cuts.

30. (New) The improvement as claimed in claim 29 wherein said bridge of material is spaced outwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

31. (New) The improvement as claimed in claim 29 wherein said bridge of material is spaced inwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

REMARKS

Applicants are concurrently filing this Amendment with an Information Disclosure Statement and a Request for Continued Examination in response to the Notice of Allowance. Accordingly, the Issue Fee has not been paid in response to the Notice of Allowance.

Claims 1-9 and 17-31 are pending. Claims 18-31 are newly-presented.

Reconsideration of claims 1-9 in view of the amendments and the prior art cited in the Information Disclosure Statement is requested. Consideration of claims 17-31 in view of the amendments to claim 17 and the prior art cited in the Information Disclosure Statement is requested. Applicant submits that claims 17-31 should be examined with claims 1-9.

Applicant reserves the right to file a divisional application on claims 10-16 which were canceled in response to the Office Action dated April 10, 2003.

Should the Examiner have any questions regarding this Amendment, the Examiner is invited to contact one of the undersigned attorneys at (312) 704-1890.

Respectfully submitted,

Dated: Feb. 20, 2004

ALLOWED CLAIMS FOR U.S. SERIAL NO. 09/904,287

A laundry machine drum having a sheet material skin including an arrangement of a plurality of perforations therethrough, each of one or more of said perforations including:

a shear cut in said sheet material, the sheet being deformed in the region of said shear cut such that the edge of the sheet material of one side of said shear cut is offset from the edge of the sheet material of the other side of said shear cut over at least some of the length of said shear cut such that an opening is formed between said offset edges and the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation;

wherein said drum skin includes a plurality of dish like depressions on its inner surface, with at least one said drum perforation located within each said dish.

2. A laundry machine drum as claimed in claim 1 wherein said deformed sheet material the material of one said side of said shear cut is displaced outward from the material of the other side of said shear cut relative to the intended spin axis of said drum, but the planar orientation of said regions immediately adjacent the edges of said regions at said shear cut are parallel to one another.

3. A laundry machine drum as claimed in claim 2 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

4. A laundry machine drum as claimed in claim 1 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

5. (Cancelled)

6. A laundry machine drum as claimed in claim 4 wherein said group of drum perforations is located within a dish in the drum skin extending outwardly relative to the drum spin axis.
7. A laundry machine drum as claimed in claim 6 wherein said dish includes two said perforations opposingly oriented to one another such that the shear cuts thereof are parallel and a bridge of material is defined by said parallel cuts.
8. A laundry machine drum as claimed in claim 7 wherein said bridge of material is spaced outwardly further than the remaining material of said dish or dimple relative to said drum spin axis.
9. A laundry machine drum as claimed in claim 7 wherein said bridge of material is spaced inwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

Claims 10-16 (Cancelled)

17. In a laundry machine having a drum with a sheet material skin including an arrangement of a plurality of openings therethrough, which drum is spun at high speed in a dehydration operation to extract wash liquids by centrifugal forces, the improvement comprising: at least one of said opening having a form such that the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said opening than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said opening, such that fabric spans said openings but does not extrude through said openings during said centrifugal dehydration.
18. The improvement as claimed in claim 17 wherein said form of said openings is such that material surrounding said opening does not project into said drum beyond said general plane of said drum skin.

19. The improvement as claimed in claim 18 wherein said apparent area of said opening when viewed from substantially perpendicular to the general plane of said drum skin in said regions of said opening is substantially zero.

20. A laundry machine having a drum as claimed in claim 17 wherein said apparent area of said opening when viewed from substantially perpendicular to the general plane of said drum skin in said regions of said opening is substantially zero.

21. In a laundry machine having a drum for holding a laundry load, which drum is spun at high speed in a dehydration operation to extract wash liquids by centrifugal forces, the drum having a sheet material skin including an arrangement of a plurality of perforations therethrough, the improvement comprising each of one or more of said perforations including:

a shear cut in said sheet material, the sheet being deformed in the region of said shear cut such that the edge of the sheet material of one side of said shear cut is offset from the edge of the sheet material of the other side of said shear cut over at least some of the length of said shear cut such that an opening is formed between said offset edges and the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation.

22. The improvement as claimed in claim 21 wherein said drum perforation is such that during said centrifugal dehydration said fabric spans said perforation but does not extrude through said perforation.

23. The improvement as claimed in claim 21 wherein said perforation does not project into said drum beyond said general plane of said drum skin.

24. The improvement as claimed in claim 23 wherein said deformed sheet material the material of one said side of said shear cut is displaced outward from the material of the other side of said shear cut relative to the intended spin axis of said drum, but the planar orientation

of said regions immediately adjacent the edges of said regions at said shear cut are parallel to one another.

25. The improvement as claimed in claim 24 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

26. The improvement as claimed in claim 21 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.

27. The improvement as claimed in claim 21 wherein said drum skin includes a plurality of dish-like depressions on its inner surface, with at least one said drum perforation located within each said dish.

28. The improvement as claimed in claim 26 wherein said group of drum perforations is located within a dish in the drum skin extending outwardly relative to the drum spin axis.

29. The improvement as claimed in claim 28 wherein said dish includes two said perforations opposingly oriented to one another such that the shear cuts thereof are parallel and a bridge of material is defined by said parallel cuts.

30. The improvement as claimed in claim 29 wherein said bridge of material is spaced outwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

31. The improvement as claimed in claim 29 wherein said bridge of material is spaced inwardly further than the remaining material of said dish or dimple relative to said drum spin axis.

12. A laundry machine having a drum as claimed in claim 9 wherein said apparent area of said opening when viewed from substantially perpendicular to the general plane of said drum skin in said regions of said opening is substantially zero.
13. In a laundry machine having a drum for holding a laundry load, which drum is spun at high speed in a dehydration operation to extract wash liquids by centrifugal forces, the drum having a sheet material skin including an arrangement of a plurality of perforations therethrough, the improvement comprising each of one or more of said perforations including:

a shear cut in said sheet material, the sheet being deformed in the region of said shear cut such that the edge of the sheet material of one side of said shear cut is offset from the edge of the sheet material of the other side of said shear cut over at least some of the length of said shear cut such that an opening is formed between said offset edges and the apparent area of said opening is greater when viewed from at least one direction substantially parallel to the general plane of said drum skin in the region of said perforation than when viewed from a direction substantially perpendicular to the general plane of said drum skin in said region of said perforation.
14. The improvement as claimed in claim 13 wherein said drum perforation is such that during said centrifugal dehydration said fabric spans said perforation but does not extrude through said perforation.

UNITED STATES PATENT AND TRADEMARK OFFICE
CERTIFICATE OF CORRECTION

PATENT NO. : 6,776,015 B2
DATED : August 17, 2004
INVENTOR(S) : Neville David Seagar and Alex David Salisbury

Page 4 of 5

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Column 4, line 62 through Column 6, line 28 (cont'd),

15. **The improvement as claimed in claim 13 wherein said perforation does not project into said drum beyond said general plane of said drum skin.**
16. **The improvement as claimed in claim 15 wherein said deformed sheet material the material of one said side of said shear cut is displaced outward from the material of the other side of said shear cut relative to the intended spin axis of said drum, but the planar orientation of said regions immediately adjacent the edges of said regions at said shear cut are parallel to one another.**
17. **The improvement as claimed in claim 16 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.**
18. **The improvement as claimed in claim 13 wherein said drum includes at least one group of two or more said perforations, said group defined by their proximity to one another, said openings of said group of perforations facing a common centre.**
19. **The improvement as claimed in claim 18 wherein said group of drum perforations is located within a dish in the drum skin extending outwardly relative to the drum spin axis.**
20. **The improvement as claimed in claim 19 wherein said dish includes two said perforations opposingly oriented to one another such that the shear cuts thereof are parallel and a bridge of material is defined by said parallel cuts.**
21. **The improvement as claimed in claim 20 wherein said bridge of material is spaced outwardly further than the remaining material of said dish or dimple relative to said drum spin axis.**
